

# Summary & Highlights

Congratulations! You have completed this lesson! At this point, you know:

- Performance monitoring, dashboards and reports, and server/database logs help identify bottlenecks.
- Database automation is the use of unattended processes and self-updating procedures for basic database tasks.
- Some automation processes include backing up, truncating, and restoring databases.
- Reports give a regular overview of database health, notifications give a forewarning of a situation that could become troublesome if not addressed, and alerts bring awareness to an issue that needs immediate attention.
